

## ~LEARNING~

---

It is useful to learn about learning techniques so we can find what fits our style. This being said, one person might not learn the same way as another. This is okay, however it does not exactly match societal concepts. In society we are taught to learn in the same environment, capacity and technique.

We have to learn (at times) auditorily, visually or kinesthetically. We are given a test, an essay, a book or online interactive activity. All the while, #1 might not like reading a book just as #2 might not dig the online exercise. They have other strengths though. And thats the point.

The way to learn the way you like to learn is to first understand which learning technique is for you, then pursue it. Academia might not offer you the exact needs required for a uniquely made teacher..

I think learning styles affect how we learn. Since everyone is unique and different, we need multiple styles to fit each individual. If an auditory learner gets caught up in the visuals, they might not learn as optimally as they can. Your learning technique will be a direct result of the outcome.
